"Structure of a new crystal form of human hap70 ATPase domain.";

L Acta Crystallogr. D 55:1105-1107(1999).

Preexistent proteins against aggregation and mediate the folding of newly translated polypeptides in the cytosol as well as within organelles. The HSP70s in mitochondria and the endoplasmic reficulum play an additional role by providing a driving force for protein translocation. They are involved in signal transduction pathways in cooperation with HSP90. They participate in all these processes through their ability to recognize nonnative esegments with a net hydrophobic character exposed by polypeptides segments with a net hydrophobic character exposed by polypeptides during translation and membrane translocation, or following

Anim. Genet. 25:196-196 (1994).

PUNCTION: In cooperation with other chaperones, HSP70s stabilize preexistent proteins against aggregation and mediate the folding of newly translated polypeptides in the cytosol as well as within organelles. The HSP70s in mitochondria and the endoplasmic reticulum play an additional rolle by providing a driving force for protein translocation. They are involved in signal transduction pathways in cooperation with HSP90. They participate in all these processes through their ability to recognize nonnative conformations of other proteins. They bind extended peptide segments with a net hydrophobic character exposed by polypeptides during translation and membrane translocation, or following streas-induced damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

C -: FUNCTION: In cooperation with other chaperones, HSP70s stabilize
Dreckistent proteins against aggregation and mediate the folding
C of newly translated polypeptides in the cytosol as well as within
C organelles. The HSP70s in mittochondria and the endoplasmic
C reticulum play an additional role by providing a driving force for
Drocein translocation. They are involved in signal transduction
Dethways in cooperation with HSP90. They participate in all these
C conformations of other proteins. They bind extended peptide
S degments with a net hydrophoic character exposed by polypeptides
C stress-induced damage.
C stress-induced damage.

"Complete mucleotide sequence of a porcine HSP70 gene.";
Immunogenetics 35:286-289(1992).

-!- FUNCTION: In cooperation with other chaperones, Hsp70s stabilize preexistent proteins against aggregation and mediate the folding of newly translated polypeptides in the cytosol as well as within organelles. These professes participate in all these processes through their ability to recognize nonnative conformations of other proteins. They bind extended peptide segments with a net hydrophopic character exposed by polypeptides during translation and membrane translocation, or following stress-induced damage.
-!- SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EGERAMTRDNNLLGRFELSGIPPAPRGVPQIEVTFDIDANGILNVTATDKSTGKANKITI

These chaperones participate in all these processes through their ability to recognize nonnative conformations of other proteins. They bind extended peptide segments with a net hydrophobic character exposed by polypeptides during translation and membrane translocation, or following stress-induced damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EADKKKVI,DKCQEVISWLDANTLAEKDEFEHKRKELEQVCNPIISGLYQGAGGPGFG

"Intracellular localization and partial amino acid sequence of a stress-inducible 40-kBa protein in HeLa cells.";
Cell Struct. Punct. 17:77-86 (1992)
-!- FUNCTION: Chaperone. Isoform 2 may function as an endogenous inhibitory regulator of HSC70 by competing the cochaperones.
-!- SUBCELLULAR LOCATION: Translocates rapidly from the cytoplasm to the nuclei, and especially to the nucleoli, upon heat shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE OF 50-55; 103-107 AND 580-596.

"Identification of the 70kD heat shock cognate protein (Hsc70) and alpha-actinin-1 as novel phosphotyrosine-containing proteins in T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IsoId=Pill42-2; Sequence=VSP_002427;
TISSUE SPECIFICITY: Ubjquitous.
INDUCTION: Constitutively synthesized.
SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                                                                                                                                                                                                           Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002)

"Cloning and expression of two novel cDRAs for hsp-70-related intracellular vitamin D binding protesins.";

Submitted (APR-1999) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Chaperone. Isoform 2 may function as an endogenous inhibitory regulator of HSC70 by competing the cochaperones (By similarity).

-!- SUBCELULAR LOCATION: Translocates rapidly from the cytoplasm to the nuclei, and especially to the nucleoli, upon heat shock (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Saguinus oedipus (Cotton-top tamarin).
